

METHOD AND APPARATUS FOR RISK ASSESSMENT FOR A DISASTER RECOVERY PROCESS

ABSTRACT

A method and structure for calculating a risk exposure for a disaster recovery process, including loading a user interface into a memory, the user interface allowing control of an execution of one or more risk models. Each risk model is based on a specific disaster type, and each risk model addresses a recovery utilization of one or more specific assets identified as necessary for a recovery process of the disaster type. One of the risk models is executed at least one time.
